

Hello Julie,

Thank you for the opportunity to respond and provide some comments to the proposed MWELo modifications. Lowering our water consumption during this drought is critical, however I understand the proposed MWELo modifications to be too restrictive and are unreasonable. I am against the revisions to the MWELo and I support the positions of the ASIC and ASLA on this matter.

Current planting and irrigation design for new projects are highly efficient with the use of weather based controllers, drip irrigation and high efficiency nozzles to name a few. However, the proposed MWELo changes are asking for further restrictions on new projects without addressing the thousands of older inefficient landscapes that have been installed throughout our communities, which continue to waste water.

These proposed changes need to be discussed with professionals. Changes can be made to save water, however it needs to be understood what can realistically be done and what cannot.

Thank again for your time.
